                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                            Juli-length cDNA clone (T33238) codes for the Drosophila para voltage-activated sodium channel (VASC), a protein responsible for the fast depolarising phase of the action potential that underlies electrical signaling in neurons, muscles, etc. The cDNA clone was obtd. from 3 overlapping regions of para cDNA isolated by PCR amplification using primers (see also T33239-44) assed on a published para sequence. Recombinant host cells (E.coli, yeast mammalian or insect) expressing the Drosophila para VASC can be used to identify modulators of insect VASCs, useful as insecticides and arachnicides. VASC antagonists can be used as neuroprotective sequence 6513 BP; 1681 A; 1548 C; 1702 G; 1582 T;
                                                                                                                                                         Mono-specific antibodies to voltage-activated cation channel - also new cation channel DNA, useful for identifying channel modulators, potentially useful partic. as insecticide and neuroprotective
                                                                                                                                                                                                                                                                                                                                                    Gaps

Claim 8: Fig lar.In; 39pp; English.

The cDNA is derived from 3 overlapping cDNA clones, designated are consisted from 5 overlapping cDNA clones, designated plasmid pRH3-1 (ATCC 67885), plasmid pRH4-23 (ATCC 67886) and plasmid pRH4-31 (ATCC 67887). A virus/circular DNA plasmid vector comprising the CDNA may be transformed or transfected into prokaryote/eukaryote host cell, and the resulting recombinant sodium channel protein has various therapeutic, diagnostic and prognostic uses. It may also be used to develop more effective antiarrythmic, sequence 7555 BP; 1577 A; 2309 C; 2103 G; 1566 T;

Claim 7; Fig 1; 65pp; English.

The sequence is derived from 3 overlapping clones, pRH3-1, pRH4-23 and pRH4-31.

The sequence is derived from 3 overlapping clones, pRH3-1, pRH4-23 and pRH4-31.

The clones were isolated from a cDNA library in the lambda Zap vector prepd. from mRNA obtd. from newborn rat hearts using rebrain II cDNA probe. The isolated DNA can be used to screen a brain II cDNA probe. The isolated DNA can be used to screen a brainlar human derived cardiac cDNA library for the corresponding human gene. Proteins and prognostic applications of the DNA have diagnostic therapeutic, and prognostic applications.

Claim 2; Fig 7; 80pp; English.

The sequence encodes repeat domain-II of a rat peripheral nervous system sodium channel peptide-1 alpha-subunit (PNI), with sodium channel activity, and has been isolated from a rat PCI2 subclone of PNI-4 cell culture, expressing high levels of CAMP-dependent protein-kinase-inhibitor. A CDNA library has been screened with primers 730196-97, and the product has been used as a probe to re-screen the library to isolate this sequence. The full-length capen in 730193. A probe derived from the sequence may be used in differential tissue expression studies. The peptide may be used to isolate sodium-agonists and sodium-antagonists for use as an algesise, hypotensives, antiinflammatoories, and in therapy of sodium channel associated pathology or trauma, e.g. neurological disorders. The DNA (in sense or antisense orientation) may be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4175

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                Example 1; Fig 9; 80pp; English.

The sequence encodes a rat peripheral nervous system sodium channel peptide-1 alpha-subunit (PNI), with sodium channel activity, and has been isolated from a rat PCI2 subclone PKI-4 cell culture, capressing high levels of cAMP-dependent protein kinase-inhibitor.

A cDNA library has been screened with primers 730196-97, and the product has been used as a probe to re-screen the library to roduct has been used as a probe to re-screen the library to solate the fragment given in T30192. This has been used to isolate the full-length gene. A probe derived from the sequence may be used in differential tissue expression studies. The peptide may be used to isolate sodium-agonists and sodium-antagonists for use as an algesics, hypotensives, antilnflammatchies, and in therapy of sodium channel-associated pathology or trauma, e.g. neurological disorders. The DNA (in sense or antisense orientation) may be used

The sequence encodes a human peripheral nervous system sodium channel peptide-1 alpha-subunit (PNIA), with sodium channel activity. A probe has been isolated by PCR from a human peripheral nervous system cDNA library, using probes derived from the rat PNI protein sequence (R9658-39), and has been used to screen a human dorsal root ganglion cDNA library, to give the full-length sequence, using PCR primers 730198-99 and T18167. A related sequence (730195) has also been isolated. The sodium channel peptide may be used to isolate sodium agonists and sodium-intagonists for use as analgesics, hypotensives, antiinflammatories, and in therapy of sodium channel-associated pathology or trauma, e.g. neurological disorders. The DNA (in sense or antisense orientation) may be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             oding peripheral nervous system specific sodium - useful for sodium channel-associated disease or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           3961 TTGAAAATAAATATTTTGAAACAGCTGTTATCACTATGATTTTAATGAGTAGCTTAGCTT 4020
                                                                                                                                                                                                                                                                                     The sequence encodes a human peripheral nervous system sodium channel peptide-1 alpha-subunit (PNIB), with sodium channel activity. A probe has been isolated by PCR from a human peripheral nervous system cDNA library, using probes derived from the rat PNI protein sequence (R99638-39), and has been used to screen a human dorsal root ganglion cDNA library, to give the full-length sequence, using PCR primers T30198-99 and T18167. A related sequence (T30194) has also been isolated. The sodium channel peptide may be used to isolate sodium-agonists and sodium antagonists for use as analgesics, hypotensives, antinflammatories, and in therapy of sodium channel-associated pathology or trauma, e.g. neurological disorders. The DNA (in sense or antisense orientation) may be used
                                                                                                                                              WPI; 96-251547/2>.
P-SDB: R99641.
Nucleic acid encoding peripheral nervous system specific sodium

treatment of pain

Claim 9; Page 50-58; 128pp; English.

The sequences given in T77803-06 encode the wild type and three variant forms of a rat sensory neuron sodium channel protein which is insensitive to tetrodotoxin. The proteins can be used for identifying modulators of the sodium channel. Blockers of the sodium channel will block or prevent the transmission of impulsest along sensory neurons and thereby be useful in the treatment of acute, chronic or neuropathic pain. The novel protein is found only in sensory neurons and not in gila, muscle or the neurons of the (para)sympathetic, enteric or central nervous system. The protein is found preferably in the neurons of the dorsal root ganglia or cranial ganglia.

The sequences given in T77803-06 encode the wild type and three variant forms of a rat sensory neuron sodium channel protein which is insensitive to tetrodotoxin. The proteins can be used for identifying modulators of the sodium channel. Blockers of the sodium channel. Blockers of the sodium channel will block or prevent the transmission of impulses along sensory neurons and thereby be useful in the treatment of acute, chronic or neuropathic pain. The novel protein is found only in sensory neurons and not in glia, muscle or the neurons of the (paralsympathetic, enteric or central nervous system. The protein is found preferably in the neurons of the dorsal root ganglia or cranial ganglia. This sequence contains 12 nucleotide differences to the wildtype rat DRG(SNS-B) (see also 777803) causing nine amino acid changes.

                                                                                            treatment of pain 1978; 128pp; English.

Claim 9: Page 69-78; 128pp; English.

The sequences given in T77803-06 encode the wild type and three variant forms of a rat sensory neuron sodium channel protein which is insensitive to tetrodotoxin. The proteins can be used for identifying modulators of the sodium channel. Blockers of the codium channel will block or prevent the transmission of impulses along sensory neurons and thereby be useful in the treatment of acute, chronic or neuropathic pain. The novel protein is found only in sensory neurons and not in glia, muscle or the neurons of the (para)sympathetic, enteric or central nervous system. The protein is found preferably in the neurons of the dorsal root ganglia or cranial ganglia. This sequence encodes a 2132 amino acid protein that contains a 176 amino acid repeat inserted after amino acid 585 of wildtype rat DRG(SNS-B)

scd131, a subclone of hscpl, encodes a non-dipteran sodium channel.
non-dipteran sodium channel; lepidoptera; insecticide; sensitivity;
target site; pyrethroids; marker; resistance; probes; detection;
PCR; polymerase chain reaction; Heliothis; degenerate;
Drosophila melanogaster; homologue; hspc1; para locus; scd13; ss.
                                                                                                                                                                                                                                                                                                                                                             ttggtccccggggataagatccactgtctggacatcctttttgccttcacaaagaacgtc

                                                                                                                                                                                                                                                         ò
                                                                            The sequences given in T7803-06 encode the wild type and three variant forms of a rat sensory neuron sodium channel protein which is insensitive to tetrodotoxin. The proteins can be used for identifying modulators of the sodium channel. Blockers of the sodium channel. Blockers of the sodium channel. Blockers of the sodium channel will block or prevent the transmission of impulses along sensory neurons and thereby be useful in the treatment of acute, chronic or neuropathic pain. The novel protein is found only in sensory neurons and not in glia, muscle or the neurons of the dorsal root ganglia or cranial ganglia. This the neurons of the dorsal root ganglia or cranial ganglia. This chequence represents bases 4512-6524 of wildtype rat DRG(SNS-B) (see also 177803), and encodes residues 1437-1957 of the mature protein.

Q71200-202 are the DNA sequences of the subclones, scd61, scd72, and. scd131 respectively, from the genomic clone "hscp1". The hscp1 clone is approximately 8000 bp and encodes a sodium channel protein. The clone was isolated from a pyrethroid resistant PEG-87 library. The non-dipteran sodium channel is thought to be the target site for sensitivity to a variety of different insecticides and is useful as a marker for target insensitive insecticide resistance. Q71198-99 are degenerate primers used to isolate hscp1. The primers are based on an homologous sequence of the Drosophila para locus, in particular a portion of an exon in the fourth transmembrane domain of the a-subunit.

RESULT 14 ID Q71200 standard; DNA; 2416 BP.

```
Example 2; Fig 1; 32pp; English.

O/1200-202 are the DNA sequences of the subclones, scd61, scd72, and scd131 respectively, from the genomic clone "hscp1". The hscp1 clone is approximately 8000 bp and encodes a sodium channel protein. The clone was isolated from a pyrethroid resistant PEG-87 library. The cond-tipreran sodium channel is thought to be the target site for sensitivity to a variety of different insecticides and is useful as marker for target insensitive insecticide resistance. Q71198-99 are degenerate primers used to isolate hscp1. The primers are based on an homologous sequence of the Drosophila para locus, in particular a portion of an exon in the fourth transmembrane domain of the arsubunit. Cloning_method: total mRNA was oligo-(dT) primed and directionally cloned 5' -> 3' into the HindIII -> NotI sites of the lafmid BA

Primer: M13_reverse
CDNA sequence colinear to mRNA
Stretch_removed: nothing
Normalization_method: Bento Soares, P.N.A.S. 91:9228-9232(1994):

Sequencing_method: single read, full automatic; Primer: M13_reverse

/note="Organism pooled; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHL19W, testis NHT, and B-cell NCI_CGAP_CGB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M. G.E. clones 297480-302087, 68263-68739, 726408-728711, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo."
